

From Corpus into GeoRAG

GeoAI

ספטמבר 2026

בלמ"ס

Project Title

Transforms unstructured Wikipedia text into a geographically-aware knowledge graph, which is then used by a RAG system to retrieve and explore information through both natural-language queries and an interactive map.

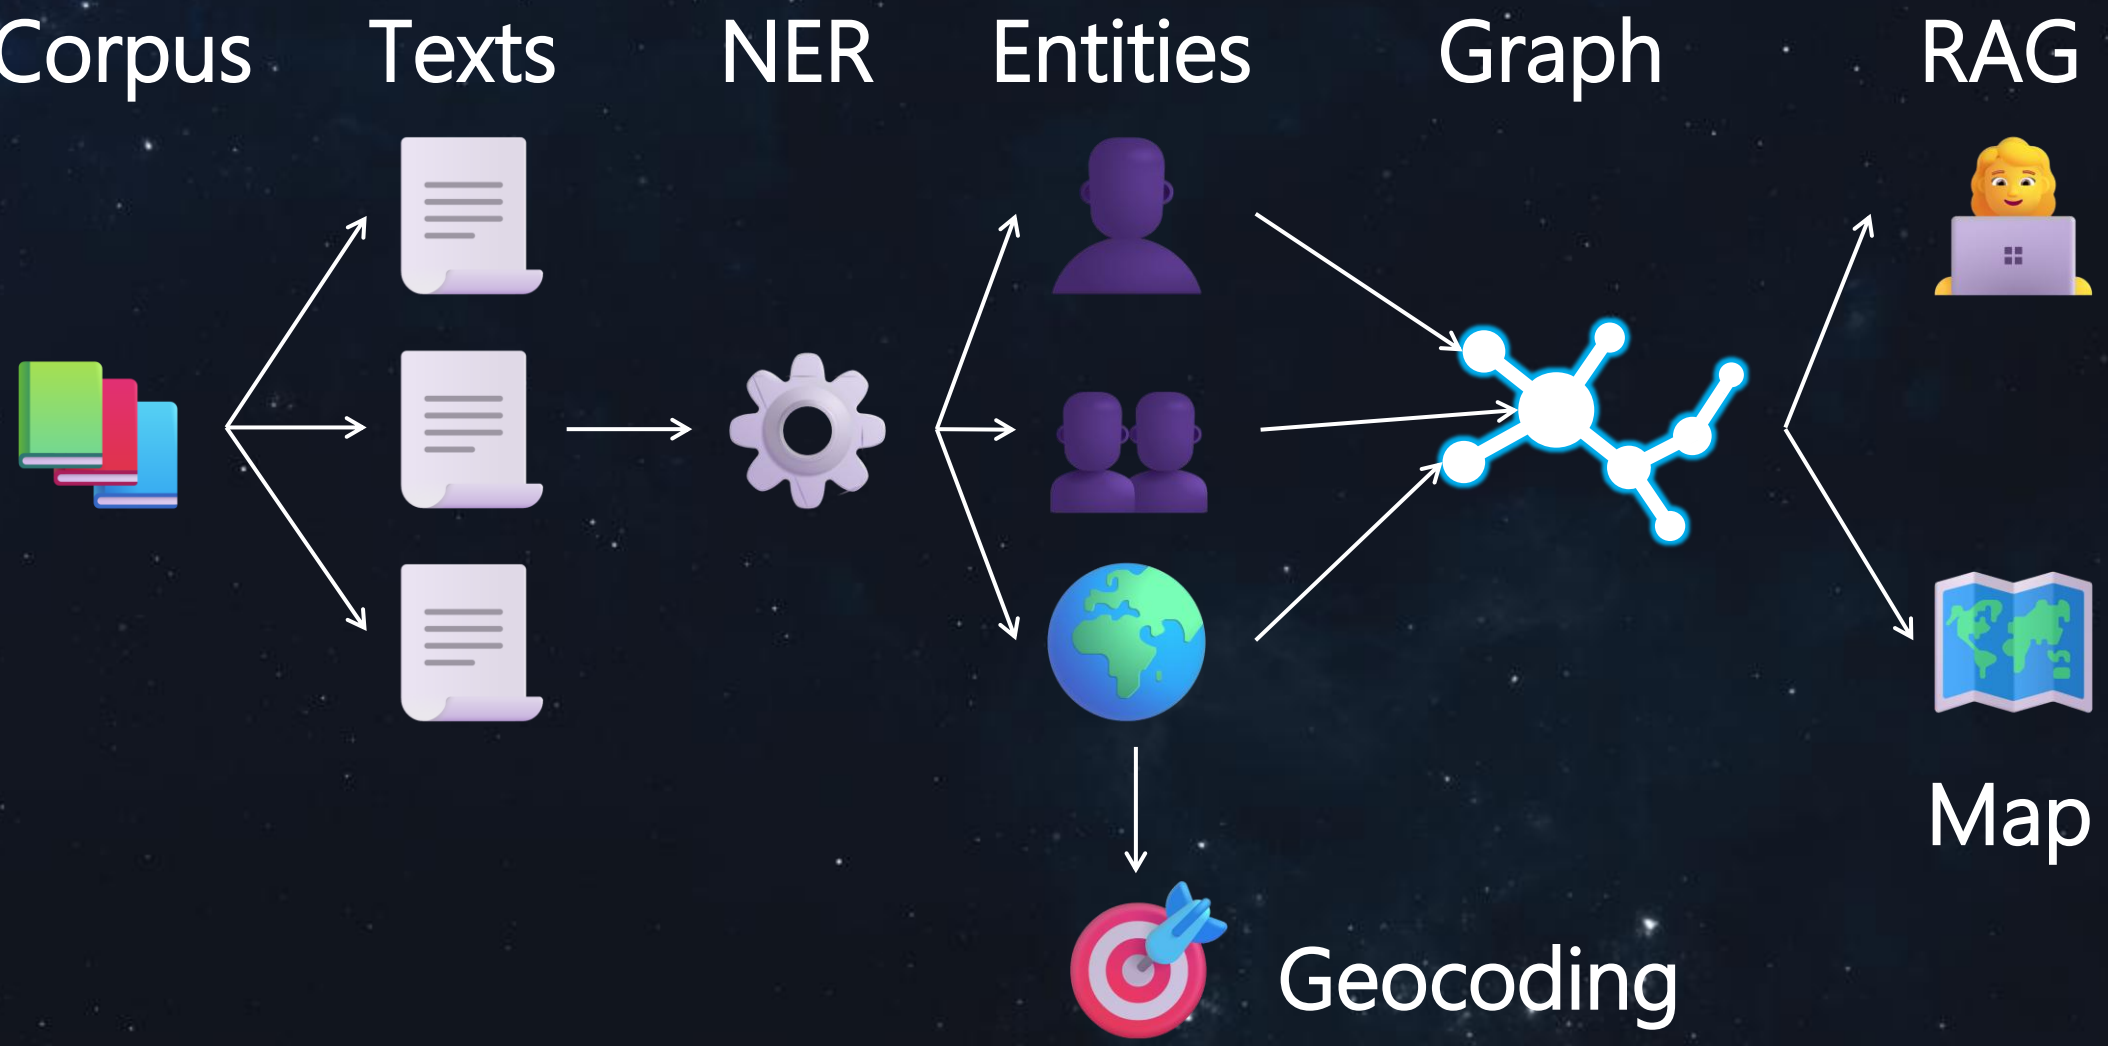

Focus: convert warfare related corpus into knowledge graph

Knowledge Graphs

A knowledge graph is a way of organizing information as entities and relationships. Instead of storing information only as text, it represents connections between things.

Project Pipeline

Project Tasks

Data Collection

Collect and preprocess Wikipedia data through the Wikipedia API.

NER

Extract and validate entities from the text

Graph & Geocoding

Geocode location entities and design the knowledge graph connecting articles, entities, and locations.

Project Tasks

Agentic RAG

Build the RAG agent for querying and exploring the knowledge graph and corpus.

UI & Map

Build the user interface and interactive map for geographic exploration of the corpus.
